Introduction to Cloud Computing

What is Cloud Computing?

- The **Cloud** term refers to software and services running on the Internet, not locally on your computer.
- So you can store and access data and programs over the internet rather than the hard drive of your computer

Cloud Computing = Application running on someone else's computer

Introduction to Cloud Computing

Evolution of the Cloud Computing

- In 1950, The idea of cloud computing came into the picture,
- In 1970, The concept of virtualization has evolved with the Internet,
- In 1997, Professor Ramnath Chellappa had mentioned the Cloud in an article,
- In 2002, Amazon Web Services (AWS) launched its public cloud,
- In 2008, Google announced a preview release of App Engine,
- In 2008, Microsoft launched Azure,
- In 2009, Alibaba launched Alibaba Cloud,
- In 2011, IBM introduced the IBM SmartCloud Project,
- In 2012, Oracle launched the Oracle Cloud.

How Cloud Works?

- Information and data are stored on physical or virtual servers that a cloud computing service can retain and monitor.
- Instead of computer or data center, a client uses an internet connection to access the stored information on the cloud.

Introduction to Cloud Computing

Parts of Cloud Computing Architecture

- The **Front-end** is the client part of cloud computing.
- User interface, applications and cloud computing platforms.
- Example: [AWS Management Console](#)

- The **Back-end** is managed by the host.
- It consists of virtual machines, data storage, security system, etc.
- Responsible for security mechanisms traffic control, etc.

Roles of Cloud Computing

Cloud Consumer

Cloud Provider

Cloud Broker

Cloud Auditor

Cloud Carrier

- A **Cloud Consumer** is an user of cloud products and services.
- The purveyor of products and services is the **Cloud Provider**.
- The **Cloud Broker** connects consumers to appropriate cloud providers.
- The **Cloud Auditor** conducts independent performance and security monitoring.
- The **Cloud Carrier** is the interconnect between datacenters and aggregated WANs.

Popular Cloud Computing App.

- Cloud usage is now spreading rapidly around the world.
- Examples of companies using cloud computing :
 - Google Drive,
 - Netflix,
 - Apple iCloud,
 - Dropbox,
 - Microsoft Office Online.

Virtualization

Virtualization

Server and Client

- A **server** is a connection point for several clients, that will handle their requests.
- A **client** is software that (usually) connects to the server to perform actions. The client provide a **user interface** that allows users to carry out actions. It forwards these requests to the server, which carries out the action and returns a response.

Virtualization

What is Virtualization?

- Virtualization refers to the operation of multiple operating systems called guests by sharing the same physical equipment resources.
- This will help the user to share a single physical resource instance or application with multiple users by providing multiple machines at the same time.

Virtualization

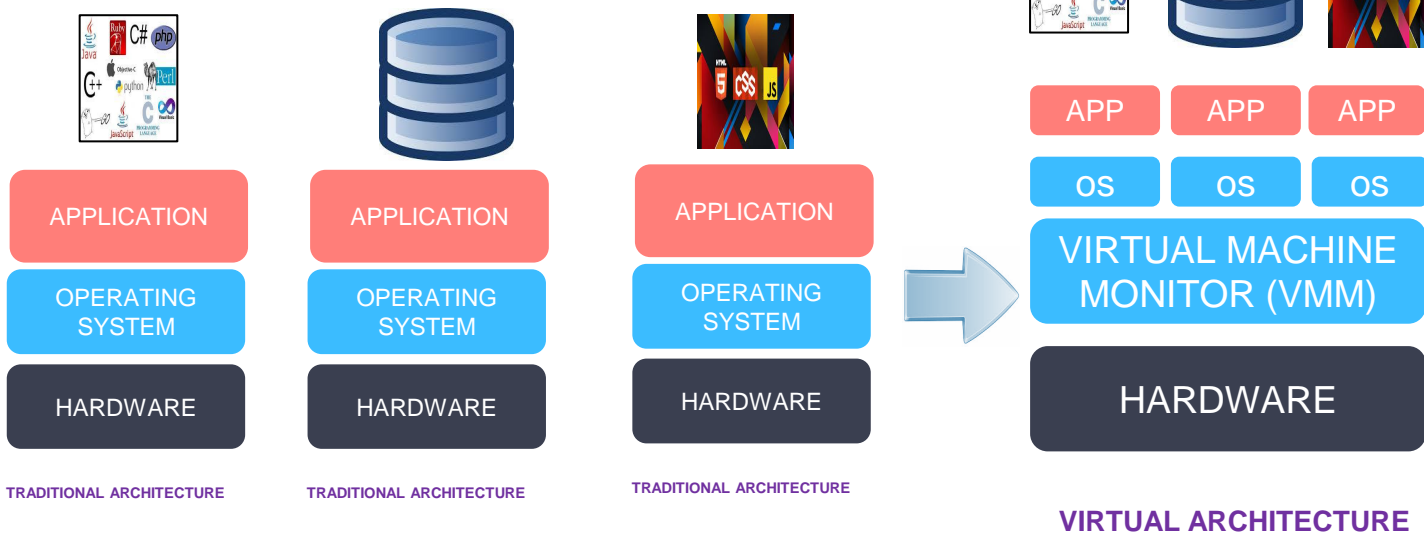

Server and Client

- Assume that you have web application, and at least you need three servers to keep application running; Front-end , Back-end and Database
- But the necessity to install these servers on separate machines creates an idle capacity for you.

Containerization Technology

Containerization Technology

What is container?

Container technology, also simply known as just a **container**, is a method to package an application so it can be run, with its dependencies, isolated from other processes.

The major public cloud computing providers, including Amazon Web Services, Microsoft Azure and Google Cloud Platform have embraced container technology.

API Gateway

API stands for Application Programming Interface. An API is a software that allows two applications to talk to each other.

An **API gateway** is an API management solution acting as the single entryway into a system for all API.

Pizza Analogy for Service Model Comparison

- **On-Premise Model;** You take **all** the ingredients-Make it yourself
- **IaaS Model;** You buy **some** ingredients- Make it yourself
- **Paas Model;** Order pizza delivered
- **SaaS Model;** Go to the pizzeria.

Public Cloud

IBM Blue Cloud

- Public Cloud is the name of the information service used for platforms that transfer data to all individuals or organizations with internet access.
- Public Clouds are owned and operated by **cloud service providers**.
- Amazon EC2, Google AppEngine, Windows Azure Services Platform, IBM Blue Cloud

Deployment Models

Private Cloud

- It means using or creating a cloud infrastructure that is dedicated to only a specific customer/organization.
- The key differences between private and public clouds;
 - Not publicly accessible
 - Private Clouds are owned and operated by your IT team.

Deployment Models

- Hybrid clouds

- Hybrid clouds use both private and public clouds, depending on their purpose.
- Hybrid clouds are Integrated environments of public and private infrastructure.
- For example, You can use a **Public Cloud** to interact with customers while retaining secure data via a **Private Cloud**.

Deployment Models

Community Cloud

- If **multiple/sister companies** share use of cloud technology, it is called Community Cloud
- A community cloud, for example, may belong to a government and can be used by different departments of that government.
